UNIVERSITY OF STIRLING

Access to Degree Studies - Assignment marking sheet

Processor Grade: JC

	FAIL	UNSATISFACTORY	GOOD	VERY GOOD	EXCELLENT
Structure/organisation					
Argument/analysis					
Relevance, depth, breadth					
Research, reading, sources					
Presentation, style					

Feedback statements
 Check the items in bold within and maintain a tight focus on the specific requirements of the question. The discussion is organised in a clear and effective manner making it easy to follow the flow of your discussion and in relating aspects of your discussion to particular parts of the question.

Throughout the discussion you have highlighted a number of important points but the detail of your analysis of these points is somewhat brief and could be developed further. The range of issues that has been examined is fine but some further depth is required. Check for other sources particularly those recommended in the course documentary could help you develop the detail of your discussion further.

You have made a good attempt to draw upon a range of different sources throughout your discussion but these tend to be web-based sources. Try to make greater use of those sources that were recommended in the first question.

To improve the grade, the following would be necessary to:

- Make fuller use of recommended sources
- Provide a little more detail in the analysis of key points within your discussion.

Well done on a very good piece of work!

Tutor name: Kevin Brosnan Date: 23/06/2013

Assignment is returned to you via email and should be checked for any errors. This is a result of the automated nature of the marking process. Any queries should be raised with your tutor.

The finished product

The next method of this essay will explain is called the micro approach. This is the one that is described in the text of answer directly generated by production system (GOSL, 2012). This method is calculated by considering the essay each individual has been with them, what scores they have been given on products and services and all items have been received and the results to be added have been taken into account. This method is considered to give a better indication of how much people actually have to spend and can give a better picture of how well the economy is doing in terms of the people's monetary contribution to growth.

The last way in which this essay will look at how Gross Domestic Product is measured is called the expenditure approach. This approach measures expenditure by individual within an economy (MARTIN, 2013). This method looks at everything an individual spends on goods and services and uses this figure to calculate a Gross Domestic Product for the country. Unlike what people spend on services products such as an individual's personal food but also expenditure spending on services for the economy and also include country's expenditure when they are not in the country can have brought in during the period being assessed. This essay will try to explain some of the weaknesses that are associated with using Gross Domestic Product to calculate economic growth.

There are many weaknesses of Gross Domestic Product to consider. The first of which the essay will look at is related to its calculation accuracy. There are many weaknesses that the calculation of calculated expenditure (GOSL, 2012). Underground economy refers to any sale that is unrecorded through a business. It does not take into account such exchanges between people outside of a registered business such as paying a neighbour to cut your grass or work your car for you. This means it is not included in the economy as they get paid in cash to spend and also that the people who receive money to produce business for them do not register to the GDP record. This means that GDP does not give a full view on the country's production, as it is not including all sales of goods or services sold in the economy.

Another weakness to consider of this way of valuing how the economy is performing is that it does not take into consideration the damage that is being done to the environment in the process. It does not take into account environmental degradation (MARTIN, 2013). Gross Domestic Product is not a perfect measure of a country's economic health.
